

Dear Colleague

Aug. 31. 96

I find on further examination that the sporules of No. 41 (*Excipulma*) are cylindrical or deperate into segments which are 8-15 x  $1\frac{1}{2}$ -2.4,

1-3 septat, which would make it

Schizothyrella. I propose S. borealis ~~Ell~~

in Sacc. Differs in its dehiscence & smaller spor. from *S. australis* Sparg
