

Domus eruditissime, Hodie prope Birmingham fungillum
 in ligno putri inveni, eodem perfecte cupulae Prensianae
 hemisphaera ellipsoidea [Sturm. xxx. fig. 47] congruere judicari,
 nempe microscopii medio lenti subjectam; eadem autem
 millies aucta sporas 4-septatas lucetguter habet, v. ic.
 ideoque generi meo *Dactylella* adscribenda. Inveni.
 pyriformis [ibid. fig. 48] probabiliter non vere distincta,
 fungillum enim meum mandaque utriusque characteres
 pra se fert. — *Dactylella ellipsoidea*, candidissima,
 stipitibus tenuiter affusis, filiformibus, erectis, non v.
 pauci-septatis, 100-200 x 4 μ , interdum brevioribus, sporis
 ellipticis v. subpyriformibus, v. basi v. apice v. utrobique
 subattenuatis, utrinque duobus septis tenuissimis in-
 structis, granulosisque, medio hyalinis et magni guttatis,
 40-50 x 16-18 μ , languidius de apice stipitis ubi iconē
 Prensianae declivibus. — Septa fungi mediocriter aucti
 non visibilia. — Ibidem Coniothecium Chomatosporum, ca.
 forma variegatum, Pr. inveni; et Acrothecium Solani, titi, var.
xylogenum, hyphis non maculiculis, 120-250 μ alt., sporis 4-gut-
 tatis, denique 3-sept., semper hyalinis, 14-17 μ x 3 μ . Ibi aucti in
 W.B. Grove.
