Director Botanical Institute,  
Padova, Italy.

My Dear Sir: ---

In carrying out a botanical survey of a portion of Texas, I have found a fungus which causes a leaf-spot on the cultivated persimmon. I am a little uncertain as to the genus in which this fungus should be placed. I am enclosing with this letter a drawing of a leaf section showing the character of the spores and their method of production. The size and color is also indicated on the same card. I should like to have your opinion as to whether this specimen should be referred to the genus *Coryneum*.

Thanking you for the favor, I am

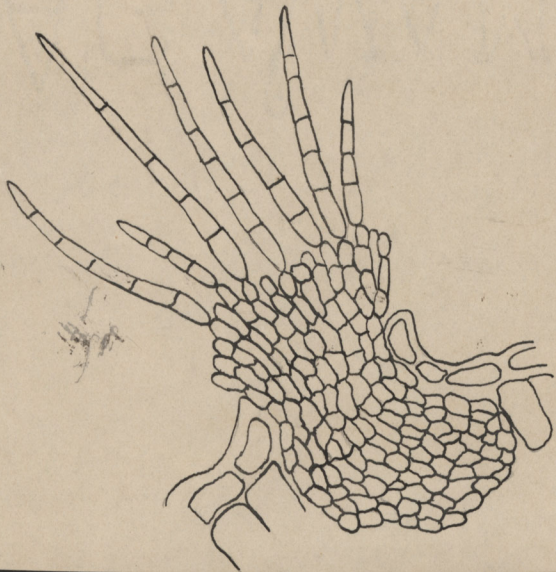

Very truly yours,

*F. D. Heald.*

SCHOOL OF BOTANY

Austin, Texas.

Leaf-spot of *Perisporium*

Spores oval, 45-60 x 3-4 $\mu$

Conidiophores and immersed  
tissue very dark brown.

*Cercospora Kaki*
